COST CURVES

- Directly plot the misclassif costs / error (in terms of prior probs)
- Might be easier to interpret than ROC, especially in case of different misclassif costs or priors

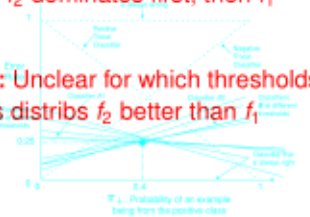
Introduction to Machine Learning

Imbalanced Learning:

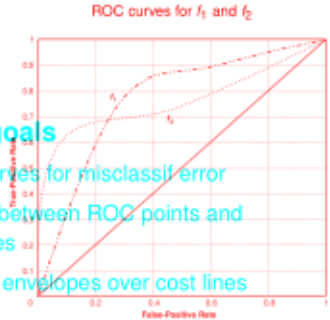
Cost Curves Part 1

Example:

- f_1 and f_2 with intersecting ROC curves
- f_2 dominates first, then f_1



BUT: Unclear for which thresholds, costs or class distribs f_2 better than f_1



Nathalie Japkowicz (2004): Evaluating Learning Algorithms : A Classification Perspective. (p. 125)

Learning goals

- Cost curves for misclassif error
- Duality between ROC points and cost lines
- CCs as envelopes over cost lines

COST CURVES

Simplifying assumption: equal misclassif costs, i.e., $cost_{FN} = cost_{FP}$

- Directly plot the misclassif costs / error (in terms of prior probs)

$\Rightarrow$ Expected misclassif cost reduces to misclassif error rate

With law of total prob, we write error rate as function of π_+:

- Might be easier to interpret than ROC, especially in case of different misclassif costs or priors

$$\rho_{MCE}(\pi_+) = (1-\pi_+) \cdot \mathbb{P}(\hat{y}=1|y=0) + \pi_+ \cdot \mathbb{P}(\hat{y}=0|y=1)$$
$$= (1-\pi_+) \cdot FPR + \pi_+ \cdot FNR$$
$$= (FNR - FPR) \cdot \pi_+ + FPR$$

Example:

- f_1 and f_2 with intersecting ROC curves
- f_2 dominates first, then f_1

Confusion matrix

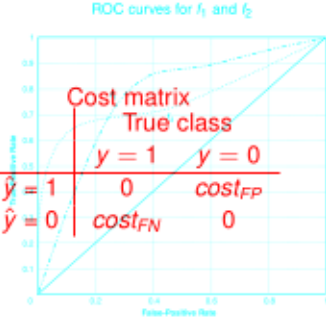
		True class $y=1$	True class $y=0$
Pred. class	$\hat{y}=1$	TP	FP
	$\hat{y}=0$	FN	TN

Cost matrix

		True class $y=1$	True class $y=0$
Pred. class	$\hat{y}=1$	0	$cost_{FP}$
	$\hat{y}=0$	$cost_{FN}$	0

BUT: Unclear for which thresholds, costs or class distrib f_2 better than f_1

ROC curves for f_1 and f_2



Nathalie Japkowicz (2004): Evaluating Learning Algorithms : A Classification Perspective. (p. 125)

COST CURVES

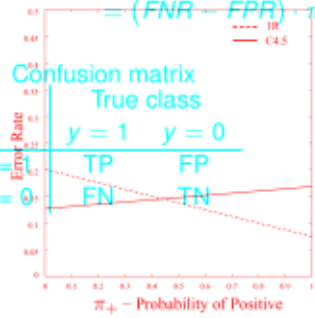
- Cost line of a classifier with slope $(FNR - FPR)$ and intercept FPR:

Simplifying assumption: equal misclassif costs, i.e., $cost_{FN} = cost_{FP}$
$\Rightarrow$ Expected misclassif cost reduces to misclassif error rate
With law of total prob, we can express error rate as function of π_+:

$$\rho_{MCE}(\pi_+) = (FNR - FPR)\,\pi_+ + FPR$$

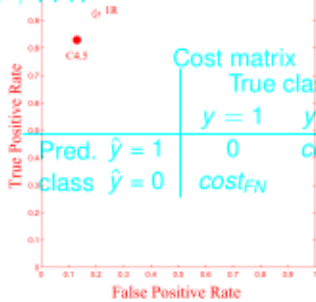
$$\rho_{MCE}(\pi_+) = (1-\pi_+)\,E(y=1|y=0) + \pi_+\,E(y=0|y=1)$$
$$= (1-\pi_+)\cdot FPR + \pi_+ \cdot FNR$$
$$= (FNR - FPR)\cdot\pi_+ + FPR$$

- Cost curves are point–line duals of ROC curves, i.e., a single classifier is represented by a point in the ROC space and by a line in cost space



Confusion matrix

		True class	
		$y = 1$	$y = 0$
Pred. class	$\hat{y} = 1$	TP	FP
	$\hat{y} = 0$	FN	TN



Cost matrix

		True class	
		$y = 1$	$y = 0$
Pred. class	$\hat{y} = 1$	0	$cost_{FP}$
	$\hat{y} = 0$	$cost_{FN}$	0

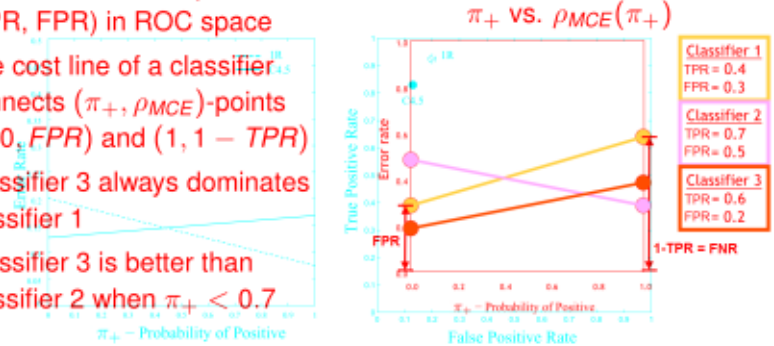
Chris Drummond and Robert C. Holte (2006): Cost curves: An improved method for visualizing classifier performance. Machine Learning, 65, 95-130 (URL).

COST LINES

Cost line of a classifier with slope $(FNR - FPR)$ and intercept FPR:

$$\rho_{MCE}(\pi_+) = (FNR - FPR) \cdot \pi_+ + FPR$$

- Cost curves are point–line duals of ROC curves, i.e., a single classifier is represented by a point in the ROC space and by a line in the cost space.
- Hard classifiers are points (TPR, FPR) in ROC space
- The cost line of a classifier connects (π_+, ρ_{MCE})-points at $(0, FPR)$ and $(1, 1 - TPR)$
- Classifier 3 always dominates classifier 1
- Classifier 3 is better than classifier 2 when $\pi_+ < 0.7$



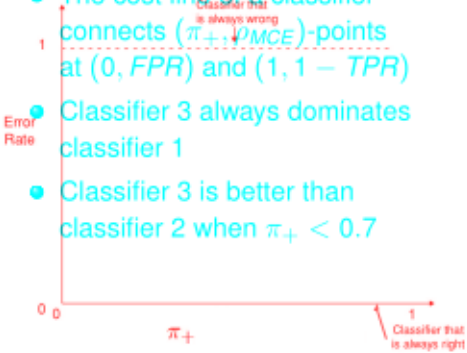
Chris Drummond and Robert C. Holte (2006): Cost curves: An improved method for visualizing classifier performance. Machine Learning, 65, 95-130 (URL).

COST LINES - EXAMPLE

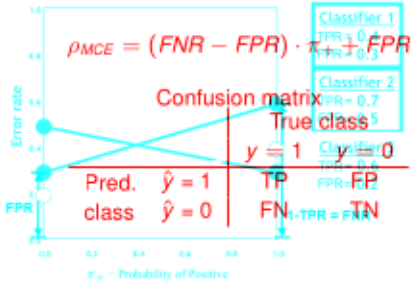
Cost lines of the new classifier (FNR, FPR) and different π_+ except FPR:

- Horizontal dashed line: worst classifier (100% error rate for all π_+) $\Rightarrow FNR = FPR = 1$
- x-axis: perfect classifier (0% error rate for all π_+) $\Rightarrow FNR = FPR = 0$

- Hard classifiers are points (TPR, FPR) in ROC space
- The cost line of a classifier connects (π_+, ρ_{MCE})-points at $(0, FPR)$ and $(1, 1 - TPR)$
- Classifier 3 always dominates classifier 1
- Classifier 3 is better than classifier 2 when $\pi_+ < 0.7$

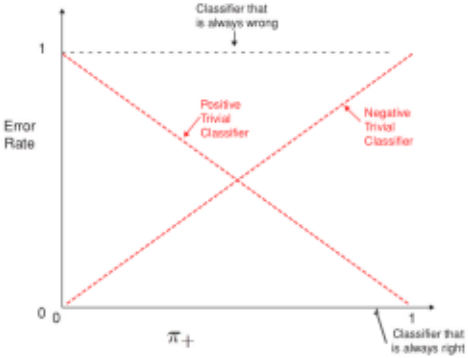


Cost lines plot different values of π_+ vs. $\rho_{MCE}(\pi_+)$



COST LINES - EXAMPLE

- Horizontal dashed line: worst classifier (100% error rate for all π_+) $\Rightarrow FNR = FPR = 1$
- x-axis: perfect classifier (0% error rate for all π_+) $\Rightarrow FNR = FPR = 0$
- Dashed diagonal lines: trivial classifiers, i.e., ascending diagonal always predicts negative instances ($\Rightarrow FNR = 1$ and $FPR = 0$) and vice versa



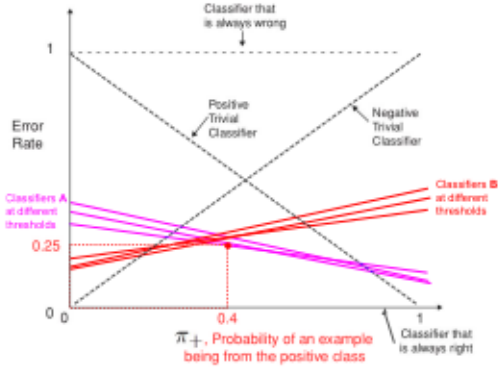
$$\rho_{MCE} = (FNR - FPR) \cdot \pi_+ + FPR$$

Confusion matrix

		True class	
		$y = 1$	$y = 0$
Pred. class	$\hat{y} = 1$	TP	FP
	$\hat{y} = 0$	FN	TN

COST LINES - EXAMPLE

- Horizontal dashed line: worst classifier (100% error rate for all π_+) $\Rightarrow FNR = FPR = 1$
- x-axis: perfect classifier (0% error rate for all π_+) $\Rightarrow FNR = FPR = 0$
- Dashed diagonal lines: trivial classifiers, i.e., ascending diagonal always predicts negative instances ($\Rightarrow FNR = 1$ and $FPR = 0$) and vice versa
- Descending/ascending bold lines: two families of classifiers A and B (represented by points in their respective ROC curves)



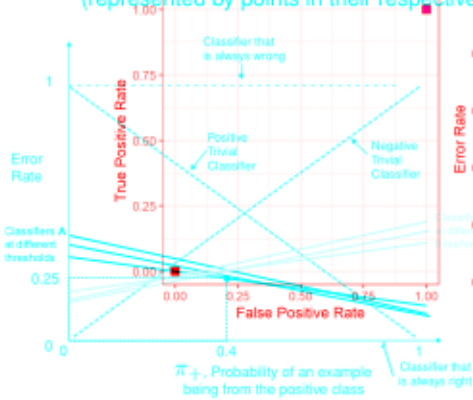
$$\rho_{MCE} = (FNR - FPR) \cdot \pi_+ + FPR$$

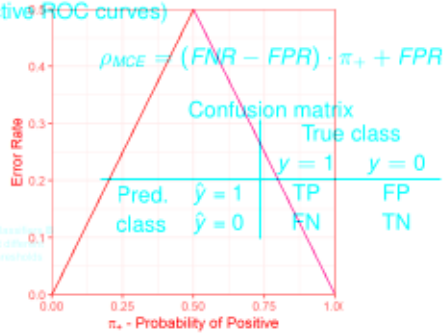
Confusion matrix

		True class	
		$y = 1$	$y = 0$
Pred. class	$\hat{y} = 1$	TP	FP
	$\hat{y} = 0$	FN	TN

VISUALIZE COST CURVE - LOWER ENVELOPE

- Left: ROC – TPR & FPR of a classifier for different prob thresholds
- Right: Corresponding cost lines
- Duality: For every ROC point we can construct the CC line, and vice versa.
- Dashed diagonal lines: trivial classifiers, i.e., ascending diagonal always predicts negative instances ($\Rightarrow FNR = 1$ and $FPR = 0$) and vice versa
- Descending/ascending bold lines: two families of classifiers A and B (represented by points in their respective ROC curves)





VISUALIZE COST CURVE - LOWER ENVELOPE

- Left: ROC = TPR & FPR of a classifier for different prob thresholds
- Right: Corresponding cost lines
- Duality: For every ROC point we can construct the CC line, and vice versa.
